ABSTRACT

(no abstract)

Key words:

This document gives all of the Voigt profile fits for the VLT many-multiplet systems analysed in the paper. Each absorber is plotted on a velocity scale, such that corresponding components align vertically. Velocities are given as differences from an arbitrary redshift, which is chosen to be close to the maximum optical depth of the absorber. The positions of fitted components are indicated by blue tick marks. Plotted above each fit are the residuals of the fit, that is [fit-data]/error, where the error is the 1σ uncertainty associated with each flux pixel. The two red lines indicate $\pm 1\sigma$, within which the residuals are expected to occur about 68% of the time if the errors are Gaussian, the error array is correct and the fitted model is a good representation of the data.

Each plot contains a maximum of 16 regions. In the event that there are more fitting regions than this, the fit is split into several parts. Each part may contain common transitions so as to provide a common reference, and to illustrate the velocity structure more clearly.
